There are a couple of solutions for bleeding air out of a cooling system. The first is to use the upper radiator hose to fill the engine. This allows the coolant to fill the engine from the top down, helping to force the air out. Once the upper hose overflows, connect it to the radiator and fill the remainder of the radiator.

Radiator Hose Location. On an LS engine, both radiator hoses route from the passenger's side of the engine. The accessories can interfere with connecting the upper radiator for certain engines and setups for folks who want to run a stock first- or second-generation F-Body radiator or in applications where a turbo or supercharger has been added.

Coolant hoses connect parts of the vehicle's cooling system together, such as the engine water outlet, radiator, water pump, and heater core. Coolant travels through the hoses, and is needed to keep many of your vehicle's systems operating smoothly. The coolant hose connector provides a leak-proof seal between the coolant hoses and the connected parts.

Once the upper mounts and the radiator hoses are removed, tilt back and lift it out—and while I've done this job alone, it's much, much easier to do it with two people to safely ease the radiator out. This is what you'll see once it's gone. With the radiator out, it's time to make quick work of everything else in the engine compartment.

You will need a -4 (90 degree) male female coupler, a -4 (45 degree) female to hose end adapter, a -4 to -6 re ducer and a -6 straight hose end. That's just to bypass the throttle body. The radiator end is a 3/8 fitting so that's were the -6 comes in. The kit was made for passing around a carburetor setup.
