Abstract: This paper proposes a nonlinear discrete-time sliding mode based tension control for deployment of tethered space robot with only length and angle measurements. The discrete-time dynamics of deployment is uncovered based on discretization of Hamilton's principle. Taking into account the underactuated dynamics, the proposed discrete-time sliding surface can generate a specified reduced-order system, which can be regarded as an uncertain discrete-time system with multiple time delays

In control systems, sliding mode control is a nonlinear control method that alters the dynamics of a nonlinear system by application of a discontinuous control signal that forces the system to "slide" along a cross-section of the system's normal behavior. The state-feedback control law is not a continuous function of time. Instead, it can switch from one continuous structure to another based on the current position in the state space. Hence, sliding mode control is a variable structure control m

One effective solution to minimize the effects of data sampling and quantization imprecisions is the use of higher order sliding modes. To this end, in this pa- per, a new formulation of an adaptive second order discrete sliding mode control (DSMC) is presented for a general class of multi-input multi-output (MIMO) uncertain nonlinear sys- tems.

Abstract. This paper mainly addresses the position and attitude tracking control for a small quadrotor UAV via discrete-time sliding mode control (DSMC). Firstly, the linear extrapolation method is used to transform the continuous-time system into discrete-time system. Based on the discrete-time system, the discrete-time flight controllers are designed to perform position and attitude tracking control of the quadrotor UAV.

Like many sliding-mode controllers, it is difficult to switch accurately on the sliding-mode surface when used for discrete control[] which easily causes chattering. To overcome the problem, a similar control law for discrete control is proposed based on the principle of control law (41) by Han [29].

This paper proposes a data-driven model-free sliding mode learning control (MFSMLC) for a class of discrete-time nonlinear systems. In this scheme, the control design does not depend on the mathematical model of the controlled system. The nonlinear system can be transformed into a dynamic linear data system by a novel dynamic linearization method. A recursive learning control algorithm is designed for the nonlinear system that can drive the sliding variable reach and remain on the sliding ...
