RNA has A, G, C, & U instead of A, G, C, & T which is found in DNA, Uracil (U) replaces Thymine (T). 3.) RNA is single-stranded instead of double-stranded, so RNA takes messages out to the ribosome to make proteins.

When protein synthesis is taking place, enzymes link tRNA to amino acids in a highly specific manner. The third form of RNA is messenger RNA (mRNA), which receives the genetic code from DNA and carries it into the cytoplasm where protein synthesis takes place.

Protein Synthesis

During the synthesis, the genetic information is transferred from the DNA molecule to the mRNA molecule. In this way, a genetic code can be used to synthesize a protein in a distant location. RNA polymerase, an enzyme, accomplishes mRNA, tRNA, and rRNA synthesis.
