DeploymentSystemData Schema. Provides validation for the SystemData.xml file exported into the content migration package. SystemData.xml does the following: Collects a variety of low-level system data. Records the number and names of Manifest.xml files (in cases where the migration uses multiple manifests). DeploymentUserGroupMap Schema

Content Migration XML Schema Reference | Microsoft Docs

Despite advances in machine learning technologies a schema matching result between two database schemas (e.g., those derived from COMA++) is likely to be imprecise. In particular, numerous instances of “possible mappings” between the schemas may be derived from the matching result. In this paper, we study problems related to managing possible mappings between two heterogeneous XML schemas.

Efficient management of uncertainty in XML schema matching

Abstract: As Web applications manipulate an increasing amount of XML, there is a growing interest in storing XML data in relational databases. Due to the mismatch between the complexity of XML's tree structure and the simplicity of flat relational tables, there are many ways to store the same document in an RDBMS, and a number of heuristic techniques have been proposed.
